ACKNOWLEDGEMENTS

We would like to thank my advisor Aj.Dr. Surapol Vorapatratorn, who has given us so many useful suggestions and guidance in this computer engineering project. Also, my parents for their help, support and encouragement. Suggestions and comments from any committees and reviewers that help improve the quality of this senior project are highly appreciated. Finally, the kindness of school of information technology's staffs, this project would not have been possible.

ABSTRACT

This project is a system for making an appointment between Mae Fah Luang university's student and lecturer. Student can make the appointment via our MFU-online lecturer appointment systems which is notify the lecturer for approval. Students are able to look up the lecturer's schedule and google calendar before making the appointment. The systems using email sending via Lamduan's mail in which students would write appointment information for permission and schedule a meeting.

This system reduces confusion and appointment missing, also helps users to manage time resources for both students and lecturers.

CHAPTER 1

INTRODUCTION

1.1 Background and Rational

Now a day, meeting between students and lecturers requires the same free time for both students and lecturers. Students who wish to meet a lecturer may have to meet at the office building or contact lecturers through one of the channels. If students do not have a contact or cannot be contacted, students only need to come and meet with lecturers at the office building. But when coming to meet the lecturer at the office building, students can only view their free time from the lecturer's teaching schedule. Whether there is a free time or is the lecturers stuck to teach. And when he came in to see him, he had to inquire if his lecturer was engaged or live in the office building. If the lecturer is not present, the students must notify the lecturers time to meet again.

We're propose an online MFU-LECTURER appointment system via the website, students and lecturers have the same free time by extracting information from the lecturer's timetable in the REG MFU and Google Calendar systems which that students can view and book their free time. However, lecturers can accept student appointments.

1.2 Objective

1.2.1 The system can appoint lecturer time via google calendar.

1.2.2 View the lecturer free time from lecturer teaching schedule and google calendar.

1.3 Scope

1.3.1 Applied to the system in School of Information Technology, Mae Fah Luang university.

1.3.2 Implement the system with web-based application.

1.6 Expected Result

- 1.6.1 Students can view lecturer's free time and make an online appointment.
- 1.6.2 Lecturers can accept or reject student's appointment via email.
- 1.6.3 Reduce lecturer appointment time process.
- 1.6.4 Prevent appointment insertion when other student is meeting with the lecturers.

1.7 Place and Equipment

- 1.7.1 Place (Locate the working place such as IT School Building and/or other places for getting requirements, testing and installing the system)
- 1.7.2 Software
 - 1.7.2.1 Xampp
 - 1.7.2.2 Google calendar API
 - 1.7.2.3 Visual studio

CHAPTER 2

LITERATURE REVIEW

Monitoring the status of lecturer in Mae Fah Luang University by using Google calendar. Because when approaching the lecturer each time we do not know whether the lecturer is in the room or not, or the lecturer may be stuck giving advice to others. For defend the problem that will occur when someone wants to meet the lecturer so that you won't get stuck with this problem.

This program will publish the status of lecturer in Mae Fah Luang University to help students know the status of the lecturer This allows students and lecturer to save time in appointment and to avoid interference during the consultation and be able to view them from anywhere the Internet access. And this program can view the acceptance-rejection of attendance among students and can also be used in the administrative assessment.

The device status is displayed as a real-time online website and allows users to access it anytime and anywhere.

2.1.1 Conventional system

Each time appointment with the lecturer, students who want to appoint the lecturer expects that the time to appoint the teacher Will the teacher have free time exactly as the students appoint or is the teacher attached to personal business.

Figure 2.1 Conventional system

2.1 Related Work

MFU-LECTURER APPOINTMENT SYSTEM is a project allow lecturer and students to acknowledge the status of lecturer when lecturer has free time or busy.

This project is also using the GOOGLE CALENDAR and lecturer's schedule in Reg MFU for booking and show the status of each lecturer. And show acceptance-rejection of attendance rate in MFU-lecturer appointment system on online website.

2.2 Technology and Tools

2.1.2 Bootstrap

Bootstrap [1], originally named Twitter Blueprint, was developed by Mark Otto and Jacob Thornton at Twitter as a framework to encourage consistency across internal tools. Before Bootstrap, various libraries were used for interface development, which led to inconsistencies and a high maintenance burden. According to Twitter developer Mark Otto: A super small group of developers and I got together to design and build a new internal tool and saw an opportunity to do something more. Through that process, we saw ourselves build something much more substantial than another internal tool. Months later, we ended up with an early version of Bootstrap as a way to document and share common design patterns and assets within the company. After a few months of development by a small group, many developers at Twitter began to contribute to the project as a part of Hack Week, a hackathon-style week for the Twitter development team. It was renamed from Twitter Blueprint to Bootstrap, and released as an open-source project on August 19, 2011. It has continued to be maintained by Mark Otto, Jacob Thornton, and a small group of core developers, as well as a large community of contributors. [[https://en.wikipedia.org/wiki/Bootstrap_\(front-end_framework\)](https://en.wikipedia.org/wiki/Bootstrap_(front-end_framework))]

Figure 2.4 Bootstrap

2.3.2 Google calendar

Google calendar is a time-management and scheduling calendar service developed by Google. It became available in beta release April 13, 2006, and in general release in July 2009, on the web and as mobile apps for the Android and iOS platforms. Google Calendar allows users to create and edit events. Reminders can be enabled for events, with options available for type and time. Event locations can also be added, and other users can be invited to events. Users can enable or disable the visibility of special calendars, including Birthdays, where the app retrieves dates of births from Google contacts and displays birthday cards on a yearly basis, and Holidays, a country-specific calendar that displays dates of special occasions. Over time, Google has added functionality that makes use of machine learning, including "Events from Gmail", where event information from a user's Gmail messages are automatically added to Google Calendar; "Reminders", where users add to-do activities that can be automatically updated with new information; "Smart Suggestions", where the app recommends titles, contacts, and locations when creating events; and "Goals", where users enter information on a specified personal goal, and the app automatically schedules the activity at optimal times. CHAPTER 3

ANALYSIS AND DESIGN

3.1 System analysis

Monitoring the status of lecturer in Mae Fah Luang University by using Google calendar. Because when approaching the lecturer each time we do not know whether the lecturer is in the room or not, or the lecturer may be stuck giving advice to others. For defend the problem that will occur when someone wants to meet the lecturer so that you won't get stuck with this problem.

This program will publish the status of lecturer in Mae Fah Luang University to help students know the status of the lecturer This allows students and lecturer to save time in appointment and to avoid interference during the consultation and be able to view them from anywhere the Internet access. And this program can view the acceptance-rejection of attendance among students and can also be used in the administrative assessment.

The device status is displayed as a real-time online website and allows users to access it anytime and anywhere. Each time appointment with the lecturer, students who want to appoint the lecturer expects that the time to appoint the teacher Will the teacher have free time exactly as the students appoint or is the teacher attached to personal business.

Figure 3.1 Conventional system

3.2 System diagram

Figure 3.2 System diagram

This system used by students and lecturers to create an appointment. In the main page students look up for the lecturer, and verify lecturer schedule and office hours. Then, click appointment button on the left menu in order to write in email that include subject or topic of discussion. Afterward, the lecturer will confirm date and time of an appointment via an email the student use to contact with. When student receive the confirmation email, student can make an appointment in google calendar by clicking on Calendar button in the left menu.

3.3 Flowchart

Figure 3.3 Flowchart Students

Figure 3.4 Flowchart Lecturer

3.4 Use case diagram

For this project to make an appointment lecturer every time and not to waste time, both parties can fully consult with lecturers without anyone interfering during the discussion and can also enable the executive to assess the lecturer.

Figure 3.5 Use case diagram for lecturer and students

3.4 User interface

Figure 3.6 User interface for home page web application, User can start an appointment by click image or lecturer name for go to appointment page

Figure 3.7 Appointment page show lecturer information, teaching schedule and google calendar.

CHAPTER 4

CONCLUSION AND DISCUSSION

4.1 Conclusion

This project is a system for making an appointment between student and lecturer of Mae Fah Luang University. Student can make an appointment via MFU-online lecturer appointment systems which the systems notify the lecturer for approval. Students are able to look up the lecturer's schedule and office hours in google calendar before making an appointment. The systems use sending of email in which students would write for permission and schedule a meeting. This method act as a buffer to create order of confirmation for the lecturer to select and organize, reduce confusion and error, also help in managing time resources for both students and lecturers.

4.2 Discussion

The speed of the system depends on how fast lecturer can reply to student's email, also on student responsibility to make an appointment in google calendar afterward. Mfu-Lecturer Appointment System is a project allow lecturer and students to acknowledge the status of lecturer when lecturer has free time or busy.

This project is also using the google calendar and lecturer's schedule in reg MFU for appoint and shows the status of each lecturer. The disadvantage is Html making it hard to fix.
