COMMITTEE

ACKNOWLEDGEMENT

This project will not be successful without the kind support of the advisor, committees and all supportive persons. We would like to thank everyone for their advices and help. We would like to thank our advisors and committees have guided us. Used to develop this project this project will not be successful without a teacher to guide Thank you.

Abstract

This senior project proposes a development of a follow up work by web app that can be used in a company or university. We have developed job alerts. To be able to notify in both email and line Users can check their work via email and line systems. Without the need to check the work often make it more convenient.

CHAPTER 1

INTRODUCTION

1.1 Background and Rational

About 3 years ago, there was one incident that was the epidemic of the Covid-19 virus, causing many things to adjust to the current situation which has been adjusted for the past 3 years. Teaching is online and there are various problems arise. One of the problems is the submission of the work, which the organizers have seen what happened with the submission of this work, therefore, have thought and developed a submission system. Work that can be notified via email and to cover with users and it can notification via LINE as well. In addition, the system is designed to be easy to use and comprehensive

This project aims to develop a work submission system. The system can be used to cover as mentioned above.

1.2 Objective

- 1.2.1 To develop and design a system for work submitting via web applications
- 1.2.2 To notify work submitting via LINE and Email

1.3 Scope of Work

- 1.3.1 Function
 - 1.3.1.1 nodeJs
 - 1.3.1.2 Mysql
 - 1.3.1.3 PHP Framework
 - 1.3.1.4 SMTP
 - 1.3.1.5 LINE Notify
- 1.3.2 Software
 - 1.3.2.1 web application
- 1.3.3 Area of work
 - 1.3.3.1 User and admin can access to the system

[illegible]

1.6 Expected Result

- 1.6.1 Design and develop the system to successful.
- 1.6.2 To can keep a history of work submission
- 1.6.3 It can notify via email and line
- 1.6.4 Users and admin can access to the system

1.7 Resources

- 1.7.1 Place
 - 1.7.1.1 MFU university
 - 1.7.1.2 Various departments
- 1.7.2 Software
 - 1.7.2.1 nodeJs
 - 1.7.2.2 Mysql.
 - 1.7.2.3 React Js
 - 1.7.2.4 SMTP
 - 1.7.2.5 LINE Notify
 - 1.7.2.6 Web application

CHAPTER 2

LITERATURE REVIEW

2.1 Related Work

2.1.1 Learning Management Systems (LMSs)

Learning Management Systems (LMSs) are a vital software platform to deliver education and training courses online. They enable the creation, management and delivery of educational content making it easier for businesses of all sizes and types to administer educational content. Like any system, LMS also needs to be user-friendly and easily usable. Usability is a measure of the degree to which users can use a product or system to effectively, efficiently, and satisfactorily achieve their objectives; this means that users will be trained quickly and efficiently if the degree of usability of LMS is high

Figure 1.1 Learning Management Systems (LMSs)

2.1.2 Email

is one of most widely used services of Internet. This service allows an Internet user to send a message in formatted manner (mail) to the other Internet user in any part of world. Message in mail not only contain text, but it also contains images, audio and videos data. The person who is sending mail is called sender and person who receives mail is called recipient. It is just like postal mail service.

Components of E-Mail System :The basic components of an email system are : User Agent (UA), Message Transfer Agent (MTA), Mail Box, and Spool file. These are explained as following below.

Figure 1.2: Message Transfer Agent (MTA)

2.2 Related Technology

2.2.1 React

We will be using React for frontend and react it Created by Facebook in 2011 and then open-sourced in 2013, React is a declarative, efficient, and flexible JavaScript library for building interactive user interfaces that are influenced by XHP, an HTML component library for PHP.

React is commonly used to develop web apps that require constant data changes on their UIs. Think of Facebook and Instagram, where you scroll to see new posts and content while most page sections remain the same.

A traditional approach would require the entire website (or app) to reload every time you click on something, which is time-consuming and frustrating for visitors.

React avoids reprocessing every line of code by using pieces of UI called components.

While Facebook created React for its platform, social media platforms aren't React's only use case. You can use it for various projects; look at some of them:

Figure 2.1 Data visualization

Airframe is a free, open-source dashboard based on React. Airframe gives developers the tools to build powerful dashboards with beautiful, clean UIs.

The tool has been designed for large projects. Its vast components library can be used to create a wide variety of custom web apps like CRMs, CMSs, dashboards, and analytics platforms.

2.2.2 Nodejs.

We will be using node.js for Backend Node.js belongs to the software category that allows developers to code applications and simultaneously run them .Node.js is an applicable solution for many different types of use cases. As a primarily server-side framework, Node.js lends itself to applications within the backend side of the technology stack. Below are a few of the instances when Node.js makes sense to use.

2.2.3 MySQL

MySQL database server provides the ultimate in scalability, sporting the capacity to handle deeply embedded applications with a footprint of only 1MB to running massive data warehouses holding terabytes of information. Platform flexibility is a stalwart feature of MySQL with all flavors of Linux, UNIX, and Windows being supported. And, of course, the open source nature of MySQL allows complete customization for those wanting to add unique requirements to the database server and guarding the data assets of corporations is the number one job of database professionals, MySQL offers exceptional security features that ensure absolute data protection. In terms of database authentication, MySQL provides powerful mechanisms for ensuring only authorized users have entry to the database server, with the ability to block users down to the client machine level being possible. SSH and SSL support are also provided to ensure safe and secure connections. A granular object privilege framework is present so that users only see the data they should, and powerful data encryption and decryption functions ensure that sensitive data is protected from unauthorized viewing. Finally, backup and recovery utilities provided through MySQL and third party software vendors allow for complete logical and physical backup as well as full and point-in-time recovery.

CHAPTER 3 ANALYSIS AND DESIGN

3.1 concept

Figureb3.1 concept : Follow Up Work

3.2 Use case diagram

In UML, use-case diagrams model the behavior of a system and help to capture the requirements of the system.

Use-case diagrams describe the high-level functions and scope of a system. These diagrams also identify the interactions between the system and its actors. The use cases and actors in use-case diagrams describe what the system does and how the actors use it, but not how the system operates internally

Figureb3.2 use case diagram : Follow Up Work

CHAPTER 4 CONCLUSION

4.1 Conclusion

FOLLOW UP WORK BY WEB APP this web application can make our work more systematic. And has job alerts via email and line systems so we don't have to check email often. To remind us that we have a job to deliver. And can enable us to deliver the work within the specified time

4.2 Discussion

At this time this project has not tried using a web application because the web building is not yet complete, however, the project is progressing smoothly. And wait for the web building to develop and continue currently the project has a few problems as our server may not be able to support enough users in a large network.
